

CUSTOMER SUCCESS STORY

By Offering Policy Control as a Virtualized Service, ClearSky Achieves a World First

Manage Your High-speed Data Traffic

ClearSky's Total Traffic Manager allows you to deliver the high speed they want, while maintaining the control you need

ClearSky delivers hosted policy control solutions on Sandvine's virtual platform

As a mobile virtual network enabler (MVNE), ClearSky provides mobile data services to mobile virtual network operators (MVNOs) across the Americas; each of ClearSky's customers typically serves 10,000 to 100,000 subscribers.

To attract new customers and grow revenue from existing customers, ClearSky uses the Sandvine platform to power a range of value-added services. One such service, the *Total Traffic Manager*, lets MVNOs optimize traffic flow on their networks and gain vital business intelligence.

A World First

When ClearSky introduced the *Total Traffic Manager* as a virtual service, it became the world's first virtualized network policy control platform—a significant achievement!

Real Benefits

The virtualized solution lets ClearSky provision and initiate virtual instances of *Total Traffic Manager* on-demand, as customers sign-up for the service and at whatever scale (large and small) is required, leading to enormous efficiencies and cost-effectiveness.

New Opportunities

"Leveraging Sandvine's network policy control products, we can help our clients manage the rapid growth in data traffic and create new services to increase data ARPU."

- Lou Grilli
Director of Product Management

About ClearSky Technologies

For more than a decade, ClearSky Technologies has been a leader in providing hosted infrastructure to mobile operators across the Americas. ClearSky's powerful array of products and services includes hosted LTE services, traffic and policy management, small cell as a service, multi-generation SMS, MMS, and mobile Internet access.
