

CUSTOMER SUCCESS STORY

UbiScope Delivers Cloud-Based Network Services to South Korean Businesses

UbiScope leverages Sandvine to expand their value-added business services

UbiScope created a packaged Network Services offering for their business customers, based on Sandvine's Cloud Services Policy Controller. Installed on an on-premises appliance, Network Services gives UbiScope's business customers insight into and control over their internet services. Plus, since the solution is virtualized, UbiScope can introduce new service components with the simplicity of a software update, letting them outpace the competition.

Taking Control

UbiScope's business customers gain greater control over their internet services.

They get real-time quality of experience reporting, network performance monitoring, and productivity controls – all through a powerful web-based management interface.

Powered by Sandvine

Sandvine's leadership in network functions virtualization (NFV) technologies makes virtualized policy control applications a reality.

These new tools let forward-thinking companies like UbiScope deliver unique services to their businesses customers.

Speeding Service Delivery

"Sandvine's Cloud Services Policy Controller will enable us to bring network management solutions to our entire business customer base faster and more cost-effectively than ever before."

- Hong-Keun Park
CEO
