

Intelligent Broadband Networks

Grow revenue by powering the connected business with value-added services

What if businesses could lower their network operations costs and increase productivity with easy-to-use value-added services built into their Internet connection?

Any Internet or IT provider who offers these services would appeal to businesses large and small, across a wide range of verticals.

The Sandvine Cloud Services Policy Controller lets you become this services provider.

Do more, with Sandvine.

Business Services

Disrupt the Market

Proprietary hardware and a requirement for onsite expertise are the status quo for business services.

Why would a business want to waste time on things that aren't core to the business itself?

In stark contrast, your business services are built into the Internet connection, so businesses can focus on what they do best.

Move Quickly

Opportunities are seized by those who move quickly – and you can move quickly with our cloud-based solution.

Unlike competing solutions that require proprietary hardware or on-premises installation, our business services use virtualization technology to get you and your customers up and running immediately.

Reap the Rewards

The market for business services is booming, even while consumer subscriber growth slows in many markets.

While other service providers are caught in a race to zero – because they have nothing special to offer – your built-in value-added services will attract new business customers and will keep your current customers coming back for more.
